March 7, 2023

## 1

For the loop  $OABCO$ , we may break it down to two planes  $OAB$ , described by the normal  $\mathbf{e}_1 = (0, -1, 1)^\top/\sqrt{2}$ , and  $OBC$ , described by the normal  $\mathbf{e}_2 = (-1, 0, 1)^\top/\sqrt{2}$ . The vector area of the loop is then given by:

$$\mathbf{S} = \mathbf{S}_1 + \mathbf{S}_2 = A_1\mathbf{e}_1 + A_2\mathbf{e}_2 = \left(-1, -\frac{1}{2}, \frac{3}{2}\right)^\top \quad (1)$$

where  $A_1 = |\vec{OA} \times \vec{OB}|/2$  and  $A_2 = |\vec{OB} \times \vec{OC}|/2$ .

We may also consider the projection of the loop onto different planes:

$$\begin{aligned} A_{xy} &= 3/2 \\ A_{xz} &= 1/2 \\ A_{yz} &= 1 \end{aligned} \quad (2)$$

Considering the orientation of the loop, we assign negative signs to  $A_{xz}$  and  $A_{yz}$ , and the results agree with the vector area. From the vector  $\mathbf{e} = (0, -1, 1)^\top/\sqrt{2}$ , the projected area is  $\mathbf{S} \cdot \mathbf{e} = \sqrt{2}$ .

The maximum projected area is  $\mathbf{S} \cdot \hat{S} = 3$ .

For the loop  $OACBO$ , we still break it down to two planes  $OAC$ , described by the normal  $\mathbf{e}_3 = \hat{z}$ , and  $CBO$ , described by the normal  $\mathbf{e}_4 = (1, 0, -1)^\top/\sqrt{2}$ . The vector area of the loop is then given by:

$$\mathbf{S} = \mathbf{S}_3 + \mathbf{S}_4 = A_3\hat{z} + A_4\mathbf{e}_4 = (2, 0, -1)^\top \quad (3)$$

$$\mathbf{S} = \mathbf{S}_3 + \mathbf{S}_4 = A_3\hat{z} + A_4\mathbf{e}_4 = (1, 0, 0)^\top \quad (4)$$

The projections are:

$$\begin{aligned} A_{xy} &= 1 \\ A_{xz} &= 0 \\ A_{yz} &= 2 \end{aligned} \quad (5)$$

From the vector  $\mathbf{e} = (0, -1, 1)^\top/\sqrt{2}$ , the projected area is  $\mathbf{S} \cdot \mathbf{e} = 1/\sqrt{2}$ .

$$\begin{aligned} A_{xy} &= 0 \\ A_{xz} &= 0 \\ A_{yz} &= 1 \end{aligned} \tag{6}$$

From the vector  $\mathbf{e} = (0, -1, 1)^\top / \sqrt{2}$ , the projected area is  $\mathbf{S} \cdot \mathbf{e} = 0$ . The maximum projected area is  $\mathbf{S} \cdot \hat{\mathbf{S}} = 1$ .

•

## 2

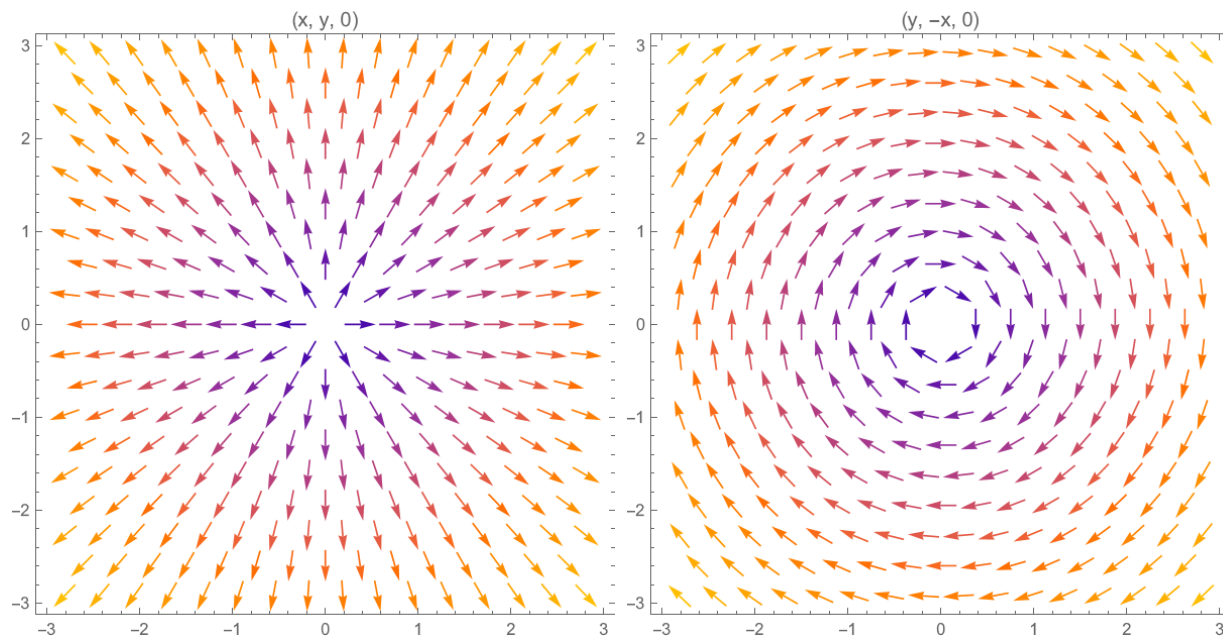

The area of the spherical cap subtended by a cone with half-angle  $\alpha$  is given by:

$$A = \int_0^{2\pi} \int_0^\alpha r^2 \sin \theta \, d\theta d\phi = (1 - \cos \alpha) 2\pi r^2 \tag{7}$$

so that the solid angle is  $\Omega = 2\pi(1 - \cos \alpha)$ .

•

## 3

It is easy to calculate that

$$\nabla \cdot \mathbf{A} = 2, \quad \nabla \cdot \mathbf{B} = 0 \tag{8}$$

The curls are given by the matrix

$$\nabla \times \mathbf{A} = \begin{pmatrix} \hat{i} & \hat{j} & \hat{k} \\ \partial_x & \partial_y & \partial_z \\ x & y & 0 \end{pmatrix} = \mathbf{0}, \quad \nabla \times \mathbf{B} = \begin{pmatrix} \hat{i} & \hat{j} & \hat{k} \\ \partial_x & \partial_y & \partial_z \\ y & -x & 0 \end{pmatrix} = (0, 0, -2)^\top \quad (9)$$

$A$  is a curl-free vector field (like an electric field), and  $B$  is a divergence-free vector field (like a magnetic field).

•

#### 4

The curl of  $\mathbf{A}$  is:

$$\nabla \times \mathbf{A} = \begin{pmatrix} \hat{i} & \hat{j} & \hat{k} \\ \partial_x & \partial_y & \partial_z \\ y & -x & z \end{pmatrix} = (0, 0, -2)^\top \quad (10)$$

The area integral of the curl on the hemisphere is given by:

$$\int_S (\nabla \times \mathbf{A}) \cdot d\mathbf{a} = -2 \int_S da_z = -2\pi \quad (11)$$

The curve  $C$  bounding the hemisphere is given by  $\{(r, \theta, 0) | r = 1, \theta \in [0, 2\pi]\}$ . The line integral of  $\mathbf{A}$  along the curve is given by:

$$\int_C \mathbf{A} \cdot d\mathbf{l} = \int_0^{2\pi} -r^2 \sin^2 \theta - r^2 \cos^2 \theta d\theta = -2\pi \quad (12)$$

as expected from Stokes' theorem.

•

#### 5

Still using polar coordinates, the line integral is given by:

$$\int_C \mathbf{A} \cdot d\mathbf{l} = \int_0^{2\pi} -r \sin^2 \theta - (3 + r \cos \theta) \cos \theta d\theta = -2\pi r = -2\sqrt{2}\pi \quad (13)$$

$$\int_C \mathbf{A} \cdot d\mathbf{l} = \int_0^{2\pi} -r^2 \sin^2 \theta + (3 + r \cos \theta) r \cos \theta d\theta = -4\pi \quad (14)$$

•

## 6

Operating in cylindrical coordinates, a point at radius  $r$  has the velocity  $\mathbf{v} = \omega r \hat{\phi}$ . The divergence and curl of  $\mathbf{v}$  are:

$$\nabla \cdot \mathbf{v} = 0, \quad \nabla \times \mathbf{v} = 2\omega \hat{z} \quad (15)$$

$\mathbf{v}$  being divergence-free means that the 'flow' is purely rotational, so a particle cannot change its  $r$  as expected from a rigid body. The flow cannot be represented by a potential field, as the curl is non-zero.

•

## 7

$$\nabla \times (\nabla \phi) = \begin{pmatrix} \hat{i} & \hat{j} & \hat{k} \\ \partial_x & \partial_y & \partial_z \\ \phi_x & \phi_y & \phi_z \end{pmatrix} = \mathbf{0} \quad (16)$$

as the double partial derivatives cancel.

$$\nabla \cdot (\nabla \times \mathbf{A}) = \nabla \cdot \begin{pmatrix} \partial A_z / \partial y - \partial A_y / \partial z \\ \partial A_x / \partial z - \partial A_z / \partial x \\ \partial A_y / \partial x - \partial A_x / \partial y \end{pmatrix} = 0 \quad (17)$$

•

## 8

First express  $d\mathbf{r}$  in terms of  $dt$ :

$$d\mathbf{r} = (2t, 2, 2t^2)^\top dt \quad (18)$$

The line integrals are given by:

$$\int_C \phi d\mathbf{r} = \int_0^1 4t^9 (2t, 2, 2t^2)^\top d\mathbf{r} = (8/11, 8/10, 8/12)^\top \quad (19)$$

$$\int_C \mathbf{F} \times d\mathbf{r} = \int_0^1 2(-t^4 - t^5, -t^5, 2t^3 + t^4)^\top d\mathbf{r} = (-11/15, -1/3, 7/5)^\top \quad (20)$$

•

9

$$\begin{aligned}
a_i b_j c_i &= (\mathbf{a} \cdot \mathbf{c}) \mathbf{b} \\
a_i b_j c_j d_i &= (\mathbf{a} \cdot \mathbf{d})(\mathbf{b} \cdot \mathbf{c}) \\
\delta_{ij} a_i a_j &= \mathbf{a} \cdot \mathbf{a} \\
\delta_{ij} \delta_{ij} &= 1 \\
\epsilon_{ijk} a_i b_k &= \mathbf{b} \times \mathbf{a} \\
\epsilon_{ijk} \delta_{ij} &= 0
\end{aligned} \tag{21}$$

$$\delta_{ij} \delta_{ij} = \delta_{ii} = 3 \tag{22}$$

•

10

$$\begin{aligned}
\nabla r^n &= \sum_i \frac{\partial}{\partial x_i} \left( \sum_j x_j \right)^{n/2} \hat{e}_i \\
&= \sum_i \frac{n}{2} \left( \sum_j x_j \right)^{n/2-1} \frac{\partial \sum_j x_j^2}{\partial x_i} \hat{e}_i \\
&= \sum_i \frac{n}{2} \left( \sum_j x_j \right)^{n/2-1} 2x_i \hat{e}_i \\
&= nr^{n-2} \mathbf{r} \\
&= nr^{n-1} \hat{r}
\end{aligned} \tag{23}$$

$$\nabla(\mathbf{a} \cdot \mathbf{r}) = \sum_i \frac{\partial}{\partial x_i} \left( \sum_j a_j x_j \right) \hat{e}_i = \sum_i a_i \hat{e}_i = \mathbf{a} \tag{24}$$

•

11

(a)

$$\nabla \cdot \mathbf{r} = \partial_{x_i} x_i = 3 \tag{25}$$

$$\nabla \times \mathbf{r} = \epsilon_{ijk} \partial_{x_j} x_k \hat{e}_i = \mathbf{0} \tag{26}$$

(b)

$$\begin{aligned}
\nabla \cdot (r^n \mathbf{r}) &= \sum_i \partial_{x_i} \left[ \left( \sum_j x_j^2 \right)^{n/2} x_i \right] \\
&= \sum_i \left( \sum_j x_j^2 \right)^{n/2} + x_i \frac{n}{2} \left( \sum_j x_j^2 \right)^{n/2-1} 2x_i \\
&= r^n + nr^{n-1}
\end{aligned} \tag{27}$$

$$\begin{aligned}
\nabla \cdot (r^n \mathbf{r}) &= \sum_i \partial_{x_i} \left[ \left( \sum_j x_j^2 \right)^{n/2} x_i \right] \\
&= \sum_i \left( \sum_j x_j^2 \right)^{n/2} + x_i \frac{n}{2} \left( \sum_j x_j^2 \right)^{n/2-1} 2x_i \\
&= 3r^n + nr^n \\
&= (3+n)r^n
\end{aligned} \tag{28}$$

$$\nabla \times (r^n \mathbf{r}) = \epsilon_{ijk} \partial_{x_j} (r^n x_k) \hat{e}_i = \epsilon_{ijk} r^{n-1} n x_j x_k \hat{e}_i = nr^{n-2} (\mathbf{r} \times \mathbf{r}) = \mathbf{0} \tag{29}$$

(c)

$$\nabla \cdot [(\mathbf{a} \cdot \mathbf{r}) \mathbf{b}] = \sum_i \partial_{x_i} \left( \sum_j a_j x_j \right) b_i = \sum_i a_i b_i = \mathbf{a} \cdot \mathbf{b} \tag{30}$$

$$\nabla \times [(\mathbf{a} \cdot \mathbf{r}) \mathbf{b}] = \epsilon_{ijk} \partial_{x_j} \left( \sum_l a_l x_l \right) b_k \hat{e}_i = \epsilon_{ijk} \delta_{lj} a_l b_k \hat{e}_i = \mathbf{a} \times \mathbf{b} \tag{31}$$

(d)

$$\nabla \cdot (\mathbf{a} \times \mathbf{r}) = \partial_{x_i} \epsilon_{ijk} a_j x_k = 0 \tag{32}$$

$$\nabla \times (\mathbf{a} \times \mathbf{r}) = \epsilon_{ijk} \partial_{x_j} (\epsilon_{klm} a_l x_m) \hat{e}_i = \epsilon_{kji} \epsilon_{klm} a_l \delta_{mj} \hat{e}_i = \delta_{il} \delta_{jm} a_l \delta_{mj} \hat{e}_i - \delta_{im} \delta_{jl} a_l \delta_{mj} \hat{e}_i = \mathbf{a} \tag{33}$$

$$\nabla \times (\mathbf{a} \times \mathbf{r}) = \delta_{il} \delta_{jm} a_l \delta_{mj} \hat{e}_i - \delta_{im} \delta_{jl} a_l \delta_{mj} \hat{e}_i = 3a_i \hat{e}_i - a_i \hat{e}_i = 2\mathbf{a} \tag{34}$$

**12**

$$\nabla \times (\nabla \phi) = \nabla \times (\partial_{x_i} \phi \mathbf{e}_i) = \epsilon_{ijk} \partial_{x_j} \partial_{x_k} \phi \mathbf{e}_i \quad (35)$$

Note that  $\epsilon_{ijk} \partial_{x_j} \partial_{x_k} = \epsilon_{ikj} \partial_{x_k} \partial_{x_j} = -\epsilon_{ikj} \partial_{x_k} \partial_{x_j} = 0$ . Therefore,  $\nabla \times (\nabla \phi) = \mathbf{0}$ .

$$\nabla \cdot (\nabla \times \mathbf{A}) = \nabla \cdot (\epsilon_{ijk} \partial_{x_j} A_k \mathbf{e}_i) = \epsilon_{ijk} \partial_{x_i} \partial_{x_j} A_k = 0 \quad (36)$$
